SHOPIFY · TECHNICAL DEBT

After four developers: who wrote what?

What's left in the code when nobody cleans up after the last one.

Swipe →

WHAT I FOUND

Layer on layer.

Before me, several developers worked on a client's Shopify store, one after the other. Each added their own layer, and **none of them cleaned up** what the previous one left behind.

THE RESULT

Rules overriding each other.

Long rules in the code overriding each other, and a fair bit of chaos.

THE REAL PROBLEM

Not the switch. The missing system.

Switching developers is fine. Without a system, every switch can add to the **technical debt**, and every single change is a risk.

Version control.

The code is under version control (GitHub, for example), so every change has a history and can be rolled back.

Work on a copy. Check every release.

Development always happens on a **separate development theme**, so the live store doesn't change. Every release is checked and followed up.
