WEBSHOP SECURITY

A 4,990 forint cart for 1 forint.

We built a test webshop to show it. A 2-minute check for any webshop built with AI.

Swipe →

WHAT HAPPENED

The browser set the price.

The checkout total was worked out **in the browser**. With the browser's developer tools, it can be changed before it's sent.

Our own test shop, simulated payment.

CHECK YOUR STORE

Network tab at checkout.

On your own store, open the Network tab at checkout. If the browser sends **the amount**, not just the product and the quantity, take a closer look.

THE FIX

The server sets the price.

The server works out the price from **its own product data**. Whatever total the browser sends is ignored.

ALSO

Reject what isn't realistic.

Negative quantities, absurdly long text: validate input **on the server**.

OWASP Input Validation Cheat Sheet
