A CUSTOM SHOPIFY BUNDLE

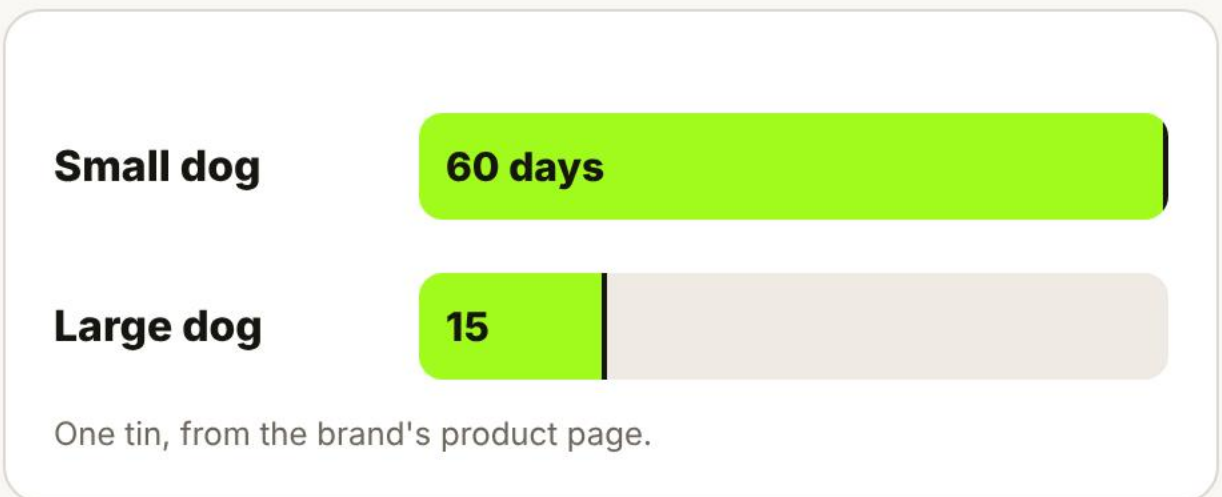

The package depends on the dog's weight. The app couldn't follow.

WHY IT'S TRICKY

One tin is 60 days for a small dog, 15 for a large one.

So the buyer picks two things: the dog's weight, then the package. The package options have to change with the weight.

One tin, from the brand's product page.

WHAT DIDN'T FIT

Almost worked.

Separate products

Each weight category was its own product, so switching reloaded the page.

The bundle app's own box

It drew its own package block, which couldn't follow the weight choice.

A second discount

On launch day, the app quietly added 10% on top of prices that already had the package discount.

LAUNCH DAY

The "almost" was in the price.

3 tins, full price	€60.00
Package price (−15%)	€51.00
App adds −10% again	€45.90

Made-up prices. So we switched the app's discount off.

WHAT I BUILT

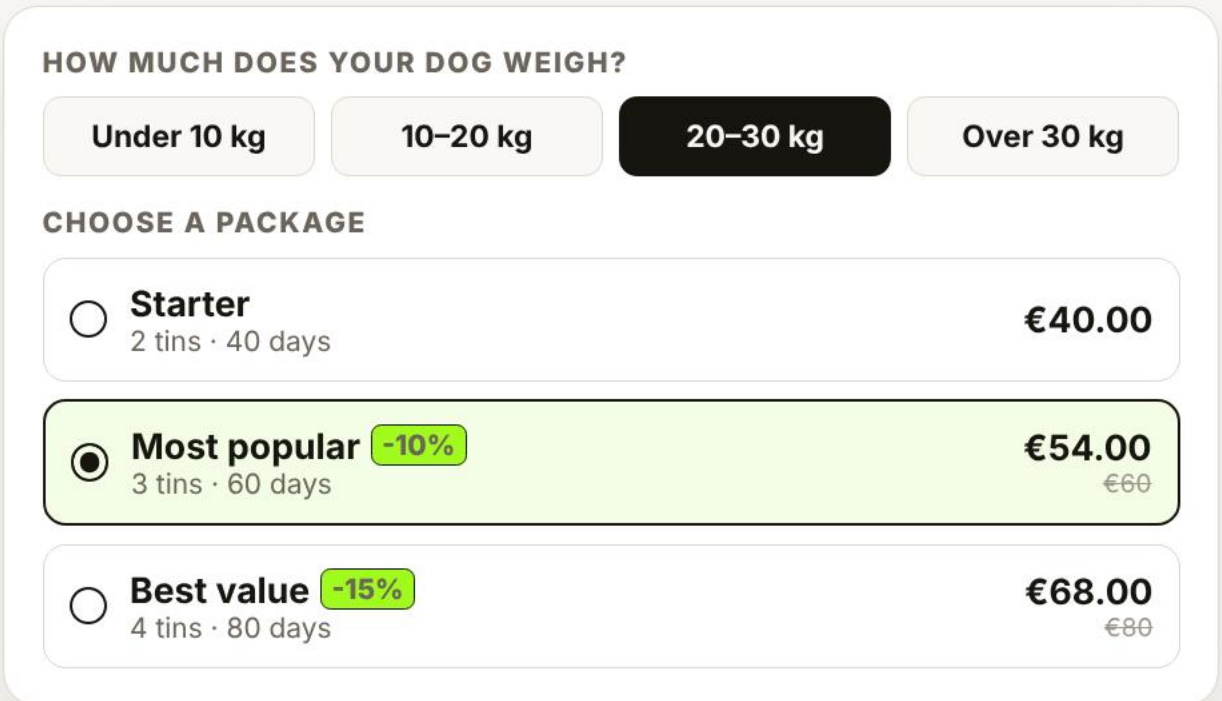

One product. Weight × package as variants.

	Starter	Popular	Best value
Under 10 kg	variant	variant	variant
10–20 kg	variant	variant	variant
20–30 kg	variant	variant	variant
Over 30 kg	variant	variant	variant

- ✔ The package price is the variant price, the original sits in compare-at.
- ✔ The cart gets the number of tins as quantity, so Shopify's own checkout does the maths.
- ✔ No bundle app, no discount function.

WHAT THE BUYER SEES

Pick the weight. The cards update, no reload.

Example, made-up prices

In the cart they can switch to a bigger package. During promotions, the free gift box goes in by itself.

WHAT I TOOK FROM IT

When an app almost fits, the "almost" is sometimes where the price goes wrong.

Live since April. I don't have before/after numbers, so I won't pretend I do.

If your bundles depend on size, dose or flavour, that's the kind of thing I like to untangle.
