PHP SECURITY RELEASE · 21 OCT 2026

Critical PHP update. Does it affect your store?

What it means for Shopify, WooCommerce, WordPress and Magento stores.

WHAT HAPPENED

Two critical flaws, fixed on 21 October.

4 new releases: 8.5.12, 8.4.27, 8.3.36, 8.2.35

9.2 CVSS score, for both flaws

0 logins needed: remote code execution

The PHP team’s advice: update immediately.

SHOPIFY

Nothing for you to update.

Shopify runs the servers, so there’s no PHP on your side. If you run your own server-side app next to the store, check that one.

Ask your host or developer.

Is PHP already on one of these versions?

8.5.12 **8.4.27** **8.3.36** **8.2.35**

Linux distributions and LTS vendors got the patches in advance, so updated packages may already be there.

PHP 8.1 OR OLDER

No official fixed release.

The PHP project no longer releases updates for these versions. Some vendors backport fixes, but the safe route is upgrading.

ONE MORE DATE

PHP 8.2 security support ends.

Not sure which PHP version your store runs on? That’s the first question to ask your host.
